EDUCATION

Bangladesh University of Business and Technology (BUBT) December 2025
B.Sc. Engg. in Computer Science & Engineering | CGPA: 3.94

TECHNICAL SKILLS

Testing: Manual, Functional, Regression, Smoke, Sanity, Exploratory, API, UI, Mobile (Android), Cross-Browser, Performance, Security (API), Test Case Design (Equivalence Partitioning, Boundary Value Analysis, Decision Table, State Transition)

Automation: Playwright (JavaScript, TypeScript, Page Object Model), Appium, WebdriverIO, UiAutomator2, Selenium, Mocha, node-pty

API & Performance: Postman, Newman, REST Validation, k6 (smoke, load, stress, spike, soak), k6-mcp-server

CI/CD & Tools: Jenkins (Pipeline-as-Code, GitHub webhooks), GitHub Actions, Docker, Allure, ngrok, Git & GitHub (branching, pull requests, merge and rebase conflicts), ADB, Chrome DevTools, VS Code

Languages: JavaScript, TypeScript, Java, SQL, HTML/CSS

Documentation & Process: Test Plans, Test Cases, Bug Reports, Traceability Matrices, Exploratory Session Sheets, Knowledge-Transfer Documentation; Jira (trained), Agile/Scrum, SDLC/STLC

AI-Assisted QA: Prompt Engineering, Claude Code, Cline, MCP-based test orchestration

PROFESSIONAL EXPERIENCE

Brain Station 23, Dhaka, Bangladesh | SQA Engineer Trainee June 2026 – September 2026

AI Chat Web App: Playwright E2E and CI *(Playwright, JavaScript, POM, GitHub Actions)*

- Established deterministic Playwright E2E coverage for an AI chat web app by mocking API/SSE responses, automating 6 P0 scenarios (login entry, authenticated bootstrap, message streaming, conversation switching, stream-error recovery, delete conversation) on fixtures and Page Objects, all passing with zero ESLint errors.
- Automated every push and pull request run with GitHub Actions, kept real Microsoft OAuth out of CI, chose Playwright over Cypress and WebdriverIO, and logged architecture, limits and what CI does not validate in a testing log.
- Audited remaining coverage, designed 9 further candidates (cancel streaming, token refresh/401 retry, rename, logout) and handed the project off.

Flutter Android E2E Automation *(Appium, WebdriverIO, TypeScript, UiAutomator2, ADB, Galaxy A13)*

- Expanded Android E2E coverage of an existing Flutter app with 11 new Appium/WebdriverIO (TypeScript) scenarios validated on a physical Galaxy A13, and reconciled project scope to 78.8% scenarios implemented (26 of 33 designed) by auditing master, open branches and test-design documents.
- Set up the device (factory reset, APK, ADB), ran the assigned 14-scenario suite, and diagnosed its one failure (chat input locator missing after rotation) for the mentor; verified locators against the live accessibility tree and built locator-health checks for 4 screens, pausing at an unlabeled switch outside the approved exceptions instead of adding one silently.
- Covered OAuth redirect and return, background/resume persistence of an AI reply, Wi-Fi interruption (one real AI send allowed), no-crash invariants and logcat sensitive-data checks, each with a manual test case; documented a Flutter input limit (328 characters read back as about 311) and deferred the rotation scenario after confirming the app is portrait-locked.
- Diagnosed missing GitHub Actions checks on pull requests (workflow unchanged, 31 earlier runs passed, no branch-protection or ruleset cause), documented why Stage 2 CI (11 authenticated scenarios) stays fail-closed without emulator snapshots, corrected docs to 22 active scenarios and recorded a knowledge-transfer walkthrough.

Interactive CLI Automation and AI Tool Evaluation *(Node.js, TypeScript, Mocha, node-pty)*

- Automated an interactive CLI's /remote-control flow (launch, UUID session ID check, chat message, teardown) with Mocha and a typed node-pty wrapper on Windows ConPTY; passed with typecheck and lint clean and no orphan processes or credential leakage, after dropping a scripted approach that source review showed could not work.

- Applied the review fix (kept the CLI's local directory out of version control) and delivered a DOCX evaluation of an in-house AI coding CLI covering its 200K context limit and output errors that needed verification.

E-Commerce Checkout QA Project *(Postman, Newman, Playwright, k6, GitHub Actions)*

- Owned a QA project for an e-commerce checkout flow: a traceability matrix mapping acceptance criteria and NFRs to manual, API, UI and performance tests, and a fully executed manual suite of positive, negative, boundary and security cases.
- Built a Postman/Newman API suite (cart, payment, invoice history, token capture, negative and boundary tests) with 5 security scenarios (missing, invalid and expired tokens, unauthenticated access, cross-user invoice access); logged defects against a bug-seeded environment and corrected assertions where the live API differed from Swagger.
- Automated 8 Playwright E2E specs on 6 Page Objects with storageState login and dynamic account registration; fixed a `data-testid` versus `data-test` misconfiguration that silently broke locators, replaced networkidle waits, and reverted to Chromium-only after documenting Firefox and WebKit failures.
- Wrote 5 k6 scripts (load, product detail, cart flow, spike, soak) with custom metrics and thresholds (p95 under 500 ms reads, 800 ms writes, errors under 1%): load and product detail failed on backend timing, spike and soak passed, cart flow was blocked and documented.
- Debugged a Docker/Composer setup failure and a database seeding gap, moved to the stable public API, and designed a 6-stage GitHub Actions workflow (lint, API, UI smoke, performance smoke, quality gates, summary).

Production Performance Testing (k6) *(k6, JavaScript, Cline, k6-mcp-server)*

- Executed 6 k6 load profiles (smoke, load 10 VUs, stress 60, spike 100, spike-high 500, soak 15 VUs for 15 minutes) against a live production e-commerce site with mentor approval, keeping timestamped HTML, CSV and JSON reports for every run.
- Scripted the authenticated journey (7 endpoints mapped in DevTools, antiforgery token extraction by regex, thresholds p95 under 1500 ms and errors under 5%) and fixed a CSV report crash from missing metrics with null checks.
- Refactored into shared helpers and six spec files driven through k6-mcp-server and Cline, and limited spike-high and soak to manual runs because the MCP server has no VU or duration caps.

Workforce Management Web App: Manual Testing *(Chrome DevTools, Excel)*

- Executed 366 manual test cases (282 API and 84 UI) across 13 modules in total; for this app, designed 84 cases for the Login, Dashboard, New Entry Form and Edit Entry Form modules, recorded results per case, and wrote the bug report.
- Bypassed an 8-hour session timeout by finding the app stores a token and refreshToken in localStorage and confirming that clearing both and refreshing logs the user out.

CI/CD and Containerization *(Jenkins, Docker, Allure, ngrok)*

- Streamlined test execution with webhook-triggered Jenkins pipelines (GitHub webhook via ngrok; clean, checkout, install, test, publish) and Allure/HTML reporting for 2 Playwright projects; moved to a Jenkinsfile on a rebuilt Jenkins environment and fixed Allure report generation.
- Resolved a Node plugin error and a Java 25/26 version conflict in a ParaBank pipeline job and added HTML report archiving.
- Dockerized a Playwright suite on the official image with volume-mounted Allure results; diffed test names to split 13 Docker failures versus 7 local into 5 environment-independent and 8 Docker-only failures caused by host hardware limits.

E-Bank Account Services: Team Automation *(Playwright, POM, GitHub Actions, Git)*

- Delivered Page Objects and 17 automated test cases for Open New Account and Update Contact Info within a team split of 176 test cases, replacing expiring static credentials with a unique user registered per suite.
- Explored behavior manually before automating and documented it: duplicate accounts from rapid double-clicks, no phone format validation, a server error on 200+ character input (3 logged as bugs) and 4 test cases skipped with reasons in code.
- Fixed a post-merge CI failure (Firefox and WebKit missing on the runner), a Linux filename-case module error and a four-file merge conflict across CI, Playwright config, package manifest and lock file.

Letter of Credit (Trade Finance) System: UI Automation *(Playwright, POM, Allure)*

- Automated UI regression for 9 pages of an LC management platform in Playwright (POM), including 10 edge-case tests built from values observed in the live DOM (blank rows, dash-string values, sub-1% percentages, whitespace-only filter, script reflection, double submit, pagination math) and further Create-page edge cases.
- Fixed an AJAX dropdown race condition in the Contract, Order and Costing cascade by polling for option labels, resolved inconsistent filter-dropdown clicks with a new selector strategy, and corrected a mislabeled race test and CommonJS imports against the project's ES modules.
- Covered popup-tab handling, buyer and shipment reports, order search and 5 status filters, Create Order defaults (14-row cost table) and Create B2B LC save-mode behavior, and logged a back-button bug.

Letter of Credit (Trade Finance) System: Manual API Testing *(Postman, Excel, SRS review)*

- Executed 282 manual API test cases across 9 modules (Contracts, Buyers, Orders, Shipments, B2B LC, Master LC, Banks, Suppliers, Master LC Workflow) covering CRUD, pagination limits, filters, invalid IDs, negative values, duplicates, field immutability and the full Master LC state lifecycle.
- Grouped recurring failures into 37 defects on 9 bug-report sheets and emailed the findings to the project manager with a recommendation to add a validation layer.

Onboarding, Test Design and Git Practice *(Postman, Newman, Git)*

- Completed Postman training (chaining, collection runner, data-driven runs, Newman with Jenkins), practiced boundary value analysis, equivalence partitioning, decision tables and state transition, ran a timeboxed exploratory session, and self-studied ISTQB Foundation chapters 1, 2 and 4.
- Practiced team Git workflow with cross-reviewed pull requests and deliberately resolved merge and rebase conflicts; took client meeting minutes for the business development team.

PROJECTS

UI Test Automation Framework, *Web Application Automation* | GitHub

- Established repeatable regression checks for 3 user scenarios, including purchase flows and edge cases, by building a Playwright (JavaScript) framework with Page Object Model across 4 page-object modules, verified on Chromium, Firefox and WebKit.
- Enabled single-scenario and full-suite execution through per-scenario npm scripts, and configured Allure reporting with automatic screenshot and video capture on failure.

Manual & API Testing, *E-Commerce Web Application* | GitHub

- Designed a test plan and 24 test cases for search, product-variation, cart and checkout flows and executed them, recording 31.6% pass rate, 5 blocked cases, and logging 18 defect reports with severity.
- Validated REST APIs with Postman and Chrome DevTools network analysis, identifying 10 UI-API mismatches, and delivered a defect log, API-vs-UI analysis and sign-off report.

CERTIFICATIONS & PROFESSIONAL DEVELOPMENT

Brain Station 23 | API Testing Foundations; Prompt Engineering Foundations 2026
Ostad | SQA: Manual & Automated Testing 2025 – 2026
